PREPARE FOR WINTER
Visit www.fertitech.com

Agriculture Continues to Embrace Knowledge as KING....

The Season's in different regions is always changing, however, certain principles of **Plant Physiology** does not change and growth phases will occur no matter how good or poor Rainfall is. Thankfully, the start in some areas has been pretty kind and it is now Decision Time on

Post Germination Management of Crops in the Broadacre.

Ferti-Tech likes to Analyse Growth Stages so we are able to apply both Granule and Liquid Combinations to enhance Productivity. Leaf Testing gives us a better understanding into how the Crop is progressing and therefore what rate and form of Elements are giving better Productivity and Dollar Efficiencies. Field Meter Testing of Nitrogen can assist in guiding the farmer on the right application rates. Potassium, Calcium, EC, Salt and Brix can also be done on the spot.

An Autumn Liquid Wedge application is an option to apply Pre-Winter to boost Slower Soil Cycling and Extend Growth deeper into Winter.

3 Day old Liquid Inject supported Wheat Germination

Improve Production whilst Buffering Against Frost, Pests and Disease.

1. Crops can be manipulated with liquids via the Leaf to Both Energise Root Mass for Deeper Stronger Moisture hunting. ie: Root Development and stored Nutrition is vital later in the Season to buffer against Crops Haying Off and to gain seed weight.
2. Compatibility with Liquid Nutrition: if need be Nutrition can be used with Herbicide Applications to support better Weed Kill, whilst **Stimulating Crop Growth**. Exemplified, over the years, by additional Tiller Development in Cereals and more robust Fat Cabbage in Canola to setup a Nutrient Dense Spiklet enabling both Volume and **Quality Seed "Oil Content" Production**.
3. Look at boosted Growth Phases ability to establish the Size and Volume of Seed Numbers along with net weight gains. The Science of **Tiller 2 - Z14 Growth Phase** is well known. The Knowledge on how to achieve this is not. Ferti-Tech is providing the support data to make it easier for Growers to know how Easy it is to incorporate it into their current practices.
4. The complexing at a Neutral Cost of Nutrition to Herbicide Application is one example. The simple use of Traces Compatible with UAN and **BioNIK** allow's a Soft Touch to the Leaf Surface to enable better Uptake of both Nitrogen and Vital Trace Elements. This provides an increase quality production and is such a simple point of difference to support a Farmers Yield.

Mixed Herbage great nodulation from Complexed Liquid Fertiliser only input

Liquid Injected new Pasture Seeding, March. Endured 5 dry weeks and a Locust Plague

Contact us 08 9725 6877 for Reading Material on how to manage extra growth potential from good seasonal conditions.
