FERTI-TECH

Getting the most out of a rough finish

With spring drawing to a close, many growers have now finished their hay/silage production for the year. Most granule fertilisers were applied without good rain to soak them in, making them largely ineffective in dry conditions. However, some growers made use of **CC-STAK**, our Carbon Coating for granule fertilisers to help make their late season granule top ups more effective, especially in the face of unpredictable spring finishes. Nothing backs this up better than feedback directly from the farmer as Luke from WA recently told us **"I think the CC-STAK coating does a great job with granule fert uptake in these tricky conditions."** Costing \$1.80/Ha based on a 100kg granule application, ask yourself why you wouldn't coat your fertiliser to value add to your granule application?

Understand what you are really feeding your livestock

As the dry conditions set in, many farmers are beginning to consider their summer supplementary feeding programs. However, how do you really know the nutritional value of your fodder?

Understanding the quality of your fodder can have many benefits for you as a grower, including: helping you to identify how well your fertiliser inputs work throughout the season, how much you really need to feed your livestock so you aren't wasting money and precious fodder and are there any potential nutrient deficiencies that may need to be supplemented? We understand the importance of animal health and the benefits good nutritional feed can have on your livestock enterprise, which is why we offer fodder sampling to show you what your animals are really eating.

SPECIAL OFFER
\$30 OFF

FULL RANGE OF SOIL TESTS* and REPORTS

*Conditions Apply - Maximum 3 Soil Tests per Property. Cost per Test Start From \$119+GST (Normally \$149+GST) Offer Ends 28th Feb. 2025.

CC-STAK™
Carbon Coat Fertiliser Coating

CC-STAK™ Maximum Fertiliser Efficiency in Soil

Out-performs All Others with a Thicker Surface Layering on DAP/MAP/SOP and Urea etc. Achieve a Much Better Carbon-Fertiliser Chelation with the Extra-Effective Carbon Coat Buffer.

Increase fertiliser efficiency and buffer against the harmful effects of a high salt-index concentrate Nitrogen in the soil with CC-STAK™ - Easy to apply and a thoroughly effective Liquid Carbon Chelating formula to protect and prevent weather induced volatilisation of hi-analysis fertilisers (conversion of Nitrogen to ammonia gas). The moisture reactive Carbon Coating of CC-STAK™ readily dissolves in the presence of water permitting fertiliser products like Urea to convert and bond its ammonia and nitrate forms with the available carbon.

The Carbon Exchange and Electrical Conductive properties of CC-STAK™ also act as a catalyst for bonding with other minerals, thereby preventing the leaching of other useful nutrition from the soil profile.

CC-STAK™ also contains micro-nutrients, trace elements, amino and humic acids for optimal performance and additional nutrient application, especially with Urea Nitrogen.

Application

- Apply inline to Auger, Conveyor, Mbar, Spray and Blend
- 5-7 Litres per tonne of Urea/MA/PA/SOP/PSOA etc.

Prevent the loss of Nitrogen and promote a far better soil microbial environment in one easy 'UP THE AUGER' rear application.

Beneficial Soil Microbes are well protected from a concentrated Nitrogen exposure. The soluble Carbon Coating is a catalyst for pH buffering, improved electrical conductivity, aerobic soil conditions and also acts as a microbial home and growth stimulant.

Now that's a Fertiliser Coating! CC-STAK

CC-STAK Also contains: FTA's, AgroCarbon, Natural Polymers, Humic Acids, Fulvic Acids, Nitrogen, Potassium, Boron, & Minor Trace Elements
