Harvesting Preparations
Visit www.fertitech.com

Silage is wrapping up across many areas, with attention now turning to hay making as conditions and paddock timing allow.

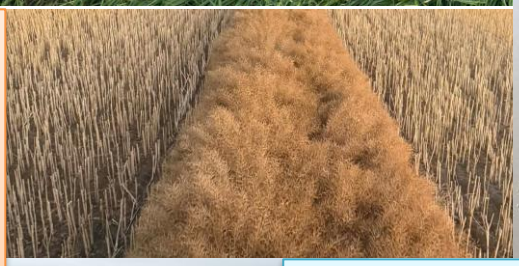

Having a grain moisture meter handy during harvest is another great way to keep an eye on grain moisture levels as you go, helping avoid harvesting too wet, minimise storage risks and make informed decisions about when to get the headers rolling.

Harvesting Preparations

Harvest preparations are starting to ramp up across the country, with some growers already getting stuck into windrowing canola in a few areas. It won't be long before headers are rolling, trucks are busy carting grain and the dust starts flying. After another season of ups and downs, everyone's hoping for a decent run at harvest, kind weather and, most importantly, a few good yields to show for the hard work. Time to get the gear ready and make the most of it!

While You're On The Header, Start Thinking About Next Season!

It's easy to have all eyes firmly on this year's crop, but there's no reason we can't start thinking about next season while we're at it. There is plenty of time to start planning, and a few questions worth asking while the current season is still fresh in your mind.

What is the plan for **Stubble Management**? Am I going to run a **Liquid Injection System** next season, or stick with **Reactive Carbon Granules (RCG)** for another year? What am I using to **buffer Herbicide applications**? Have I considered the **Nutrition going onto next year's Seed**, and are there any **Soil Amendments** that need to be factored into the program?

These are just a few things worth putting on the radar now, rather than leaving everything until the last minute when the next season is suddenly upon us. A little forward planning over harvest can make a big difference when it's time to get back in the paddock!
